

On the mineral trail - Tour of the Marguareis Nature Park - Stage 1

Chiusa di Pesio

Randonnée Marguareis. Varnes et le Marguareis en hiver (Laurent Malthieux - PNM)

Traverse from Vallone di Serpentera to Vallone di Sestrera, with a number of interesting features, from silver fir woods to the shepherds' hut and the views of the north wall of Marguareis.

This is an alternative longer route to rifugio Havis di Giorgio-Mondovi, but still on well marked paths.

Useful information

Practice : Hiking

Duration : 6 h 30

Length : 12.5 km

Trek ascent : 1365 m

Difficulty : Hard

Type : Walking breaks

Departure : Pian delle Gorre

Arrival : Havis de Giorgio-Mondovi refuge

Cities : 1. Chiusa di Pesio

Altimetric profile

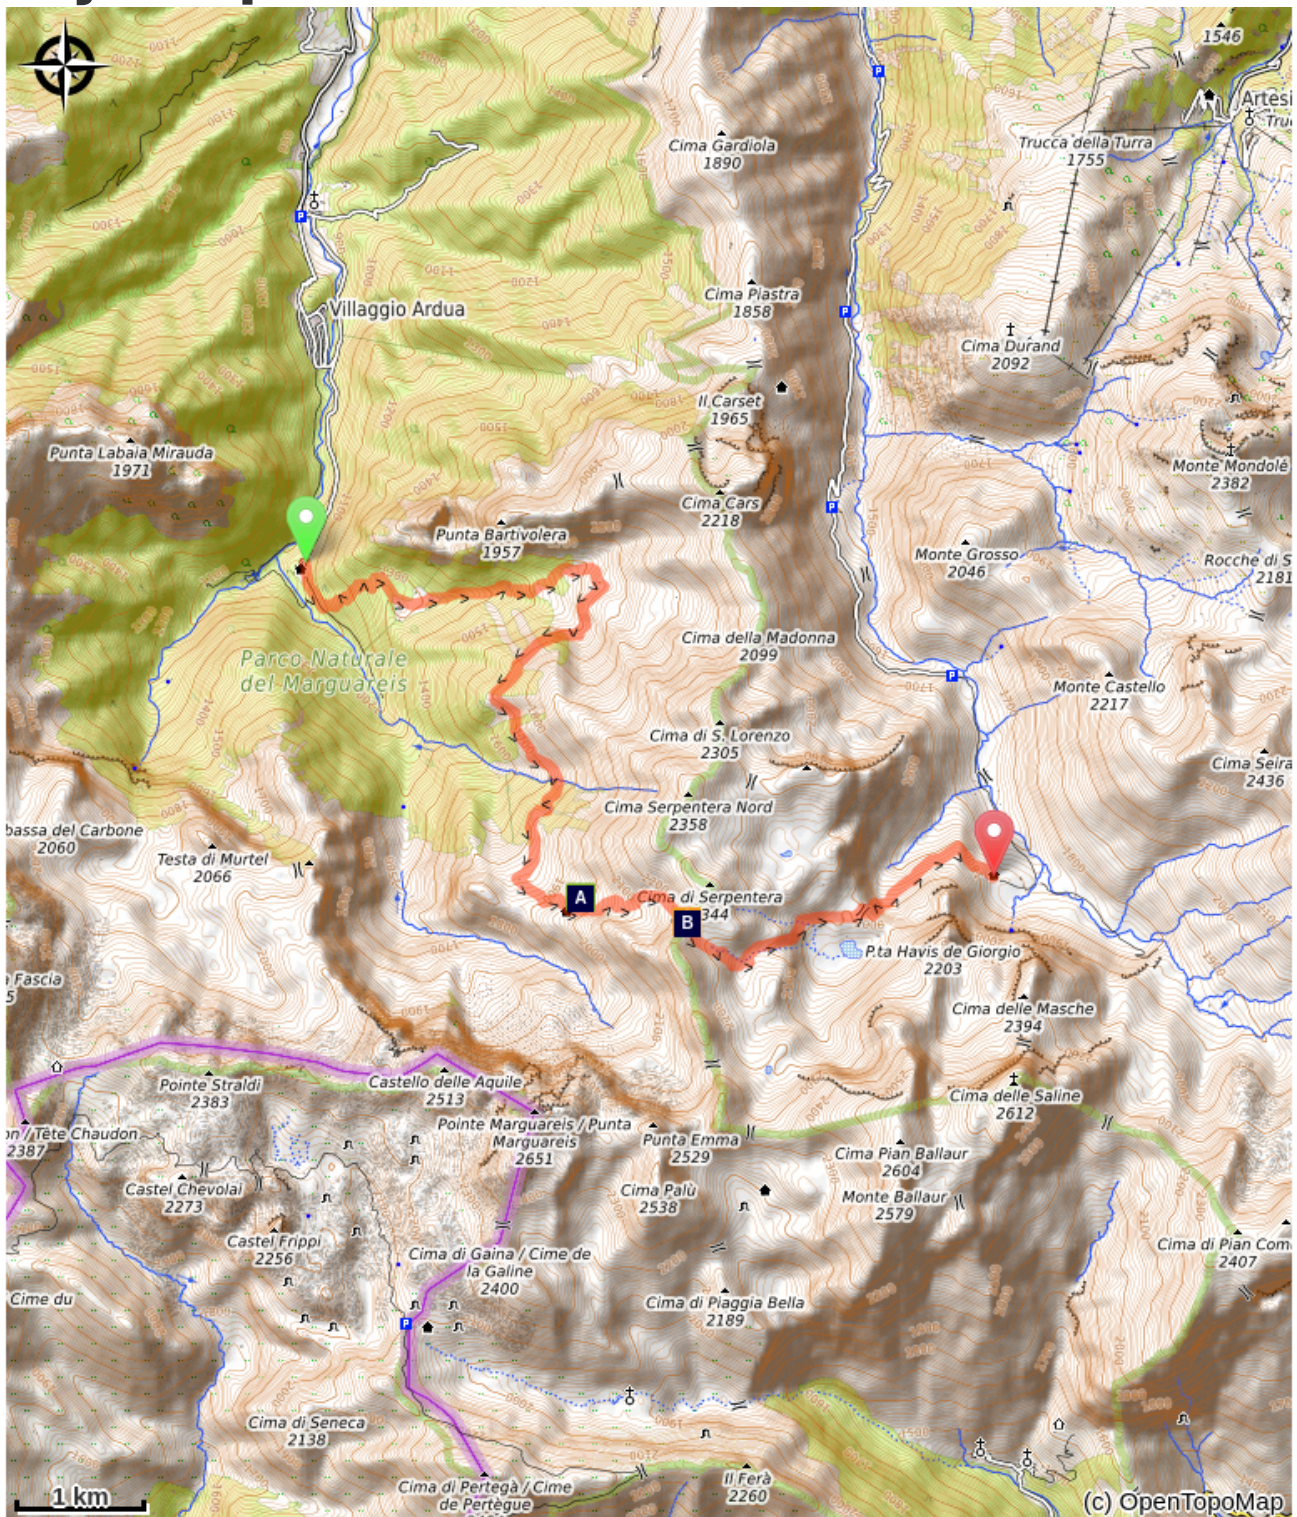

Min elevation 1033 m Max elevation 2244 m

Head left along the road from the Pian delle Gorre refuge (1 032m) then turn left towards Pian del Creus. A steep hill through the silver fir forest of Buscaiè leads to the delightful Pian del Creus (1269m). After having gone past the cool Mantras spring, you will reach Gias Madonna (1653m). Here, turn right and, having gone along past Gias della Costa, you will reach Gias Soprano di Sestrera (1842m). From there, in just over half an hour, you will reach Pian del Lupo and subsequently the Garelli refuge (1970m), where you can visit the Alpine botanical station of Bicknell-Burnat, founded by the Park with the aim of saving the many endemisms of the Maritime and Ligurian Alps. Among the species present are the endemic plants *Senecio persoonii*, *Silene cordifolia*, *Saxifraga florulenta* and *Veronica allioni*.

Close to the small Marguareis lake, there is a second botanical station, Danilo Re, which conserves the rarest and most important specimens of the Ligurian and Maritime Alps, including the paleo-endemisms *Phyteuma cordatum* and *Berardia subacaulis*, but also very rare glacial plants such as *Carex bicolor*, *Carex microglochin* and *Juncus arcticus*.

From Pian del Lupo, you will head up to Col de Porta Sestrera (2225m) heading close to the Rastelli del Marguareis, pointed siliceous outcrops scattered with fir trees. On the col which provides acces to the vast limestone high-plateau, continue along to the following fork in the path, where there is a sign for Havis De Giorgio-Mondovì and the valley of Biecai to the left. Head gently downwards until the ephemeral lake of Biecai, set against the spectacular backdrop of the Cime des Saline and the Pointe Havis De Giorgio. The path continues along to Col de Porta Biecai and then steeply down to the valley below from where, halfway down, you will reach the Havis De Giorgio-Mondovì refuge (1761m), which is located in a magnificent hollow of Pian Marchisa. In the immediate surrounding area, the Pis d'Ellero is visible: in the spring, a spectacular jet of water spurts out of the cavity on the rock face.

All useful information

On your path...

✿ The Burnat Bicknell Botanical Station (A)

The site covers over 10,000 square meters, and is named after Emile Burnat and Clarence Bicknell. Burnat, a Swiss botanist, was the author of the important work 'Flores des Alpes Maritimes'; Bicknell, an English botanist active in Valle Pesio for about thirty years, he was also the first to catalogue the rock engravings of Monte Bego.

About 500 plant species typical of the Ligurian Alps are collected in the two botanical stations, offering a unique opportunity for both enthusiasts and casual visitors. Illustrative panels describe the various environments and the botanical species are easily recognizable thanks to the scientific name on the labels.

🕒 Pier Mario Garelli (B)

The refuge was dedicated to Pier Mario Garelli when it was built. He was known to all as Piero, a lawyer and climbing partner of Sandro Comino. President of the CAI of Mondovì, immediately after the armistice he joined the Resistance, with the III Alpine Division operating in Val Casotto. He was arrested in Mondovì, and initially locked up in Turin. On May 25, 1944 he was transferred to the concentration camp at Fossoli, then to Bolzano and finally to the concentration camp at Mauthausen. He died in the subcamp of Gusen, just before the end of hostilities.

👁 The furrowed fields (C)

The 'furrowed fields' (also called 'carried fields' due to the shapes that vaguely recall the furrows left by the wheels of carts in the mud) are erosion phenomena typical of limestone rocks, due to the runoff of rainwater.
